                                                                                                                                                                               6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Parkin2; Parkinson's disease; 6q25.2-27; neurodegenerative disease; Alzhelmer's disease; Huntington's disease; amyotrophic lateral sclerosis; Multi-system atrophy; Wilson's disease; Pick's disease; Prion disease; brain tumour; head trauma; stroke; vascular irregularity;
                                                                                                                           Sequence 296 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a murine parkin2 polypeptide. The polypucleotide sequence contains a deletion, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 7; Page 44-45; 62pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                              Matches
                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent: useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIG1676-ABIG1511), expressed DNA sequences (ABIG1675) and the encoded proteins (ABE57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directlem from WIPO at ftp.wipo.int/pub/published_pct_sequences

New polynucleotides encoding mouse parkin2 protein, useful for producing a transgenic non-human animal as an animal model for neurodegenerative

Claim 7; Page 21-22; 62pp; English.

The present sequence represents a murine parkin2 polypeptide. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral

RESULT 3 US-09-601-844B-4 Sequence Application US/09601844B

Sequence 683, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

FILE REFERENCE: CLOCA107

CURRENT APPLICATION NUMBER: US/09/949,016

PRIOR APPLICATION NUMBER: 00/241,755

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR APPLICATION NUMBER: 60/231,768

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

Sequence 13, Application US/09914259
Patent No. 6495336
GRMERAL INFORMATION:
APPLICANT: Makowski, Lee
APPLICANT: Hyman, Paul
APPLICANT: Hyman, Paul
APPLICANT: Williams, Mark
TITLE OF INVENTION: STAGED ASSEMBLY OF NANOSTRUCTURES
```

```
APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 32183

LENGTH: 117

TYPE: PAT

ORGANISM: Drosophila melanogaster

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4. Application US/0978548

Patent No. US20020155577A1

GENERAL INFORMATION: PHARMACEUTICALS, INC.

PILL REPERENCE: STOODOS

CURRENT APPLICATION UNMBER: US/09/785,548

CURRENT FILING DATE: 2001-02-20

NUMBER OF SEQ ID NOS: 46

SOFTMARE: PatentIn Ver. 2.1

SEQ ID NO 4

LENGTH: 156

TYPE: PRT

ORGANISM: Homo sapiens

IsoId=Q9NVS6-3; Sequence=VSP 011716;
-ITISQUE SPECIFICITY: Expressed In all subdivisions of the brain.
Highly expressed in brainstem, cranial nerve, pontine, cerebellar nuclei, indusium grieeum, nuclei reticularis, strata oriens and laccunosum moleculare of the hippocampal CA2 region. Low levels were found in the telencephalon and diencephalon. Expressed in heart, liver, skeletal muscle, kidney and testis.

-IDEVELOPMENTAL STAGE: In late 10 dpc weakly expressed in postmitotic neurons in the mantle layer of the developing nervous system. Expression increased at 11-12 dpc. At 15-16 dpc, as more specific expression was highest in the neurites, moderate levels were observed in the migrating postmitotic neurons in the intermediate and neopallial layers. In the diencephalon and other CNS regions, while the weakest level of expression was observed in the cell bodies. In nonneural tissues, high levels of expression were found in the muscle walls of the intestine, the blood vessels and the dermis.

-IDMAIN: The ubiquitinates in an E2-dependent manner leading to its own degradation (By similarity).

-IPTM: Sunitarity: Contains 2 IBR-type zinc fingers.
-ISMILARITY: Contains 2 IBR-type zinc fingers, but these are not found by any domain detection methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWI

Biomol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      familial Parkinson's disease.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Functions within a multiprotein E3 ubiquitin ligase complex, catalyzing the covalent attachment of ubiquitin moieties onto substrate proteins. These substrates include SYT11, CCNE1, oppositions, STUB1, a 22 kDa O-linked glycosylated isoform of SNCAIP and SEPTS. May play a more general role in the ubiquitin proteasomal pathway by participating in the removal and/or detoxification of abnormally folded or damaged protein. Loss of this ubiquitin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     postsynaptic densities.
